Service Manual

Expanded TV Tuner

Model **TTX7502z**
(ZT-4610E)

■ PRECAUTIONS

1. This unit does not operate independently. The unit must be used with a center unit that has a cable connection for CeNET wire bound.
2. The CeNET cable wiring must be less than 20m(65.62ft) in length.

■ SPECIFICATIONS

Reception channels: VHF 45.75 - 224.24MHz
(1 - 12 channels)
UHF 471.25 - 855.25 MHz
(13 - 62 channels)

Antenna input: 75Ω unbalanced

Power supply voltage: 14.4V

Ground: Negative ground

Power consumption: 0.4 A or less

External dimensions(mm):
178(W)×25(H)×125(D)

Weight: 0.5kg

※ Specifications and design are subject to change without notice for further improvement.

■ COMPONENTS

ZT-4610E-A

TV tuner unit	-----	1
Ce-NET cable	855-3421-00	1
Picture RCA cable	855-5422-00	1
Parts bag	921-9472-00	1
Velcro tape(80X39 Hook)	348-0133-00	2
Velcro tape(80X39 Loop)	348-0134-00	2
Insulock tie	335-3847-00	2
Urethane seat	345-7010-00	5
PKG connection cable	850-6719-02	1

■ NOTE

We cannot supply PWB with component parts in principle. When a circuit on PWB has failure, please repair it by component parts base. Parts which are not mentioned in service manual are not supplied.

■ To engineers in charge of repair or inspection of our products.

Before repair or inspection, make sure to follow the instructions so that customers and Engineers in charge of repair or inspection can avoid suffering any risk or injury.

1. Use specified parts.

The system uses parts with special safety features against fire and voltage. Use only parts with equivalent characteristics when replacing them.

The use of unspecified parts shall be regarded as remodeling for which we shall not be liable. The onus of product liability (PL) shall not be our responsibility in cases where an accident or failure is as a result of unspecified parts being used.

2. Place the parts and wiring back in their original positions after replacement or re-wiring.

For proper circuit construction, use of insulation tubes, bonding, gaps to PWB, etc, is involved. The wiring connection and routing to the PWB are specially planned using clamps to keep away from heated and high voltage parts. Ensure that they are placed back in their original positions after repair or inspection.

If extended damage is caused due to negligence during repair, the legal responsibility shall be with the repairing company.

3. Check for safety after repair.

Check that the screws, parts and wires are put back securely in their original position after repair. Ensure for safety reasons there is no possibility of secondary problems around the repaired spots.

If extended damage is caused due to negligence of repair, the legal responsibility shall be with the repairing company.

4. Caution in removal and making wiring connection to the parts for the automobile.

Disconnect the battery terminal after turning the ignition key off. If wrong wiring connections are made with the battery connected, a short circuit and/or fire may occur. If extensive damage is caused due to negligence of repair, the legal responsibility shall be with the repairing company.

5. Cautions regarding chips.

Do not reuse removed chips even when no abnormality is observed in their appearance. Always replace them with new ones. (The chip parts include resistors, capacitors, diodes, transistors, etc). The negative pole of tantalum capacitors is highly susceptible to heat, so use special care when replacing them and check the operation afterwards.

6. Cautions in handling flexible PWB

Before working with a soldering iron, make sure that the iron tip temperature is around 270°C. Take care not to apply the iron tip repeatedly (more than three times) to the same patterns. Also take care not to apply the tip with force.

7. Turn the unit OFF during disassembly and parts replacement. Recheck all work before you apply power to the unit.

ADJUSTMENT

1. Adjustment of LLD coil and measurement of image frequency specification.

Wiring connection

Fig.1

1. Remove the solder bridge of TP101 and TP102. And input the following signal to TP102.
Frequency: P=38.9MHz S=33.4MHz (invert mode)
Output level: 85dB μ
Image signal: multi-burst signal or EBU color bar signal
Voice modulation: 1kHz 30% (± 15 kHz) Dev. MONO
2. With the multi-burst signal, measure the waveform of TP502 by oscilloscope. (Fig.2)

Fig.2

3. Adjust the IF-AGC voltage from TP501 with DC variable power supply so that the E-voltage in Fig.8 becomes approximately 1.5V.
4. Adjust the IFT507 so that the DC voltage of C or F Fig.8 becomes the minimum. When C- voltage drops and the wave form becomes unstable, adjust the IFT507 again.
5. Confirm that the H-SYNC (D) has no noise.
6. Confirm that the ratio of 4.43MHz (B) and 500kHz (A) is within the following range.
 $0.5/4.43\text{MHz} \cdots 10 \pm 4\text{dB}$
(Acceptable if A:B=5:1 more)

2. RF-AGC adjustment

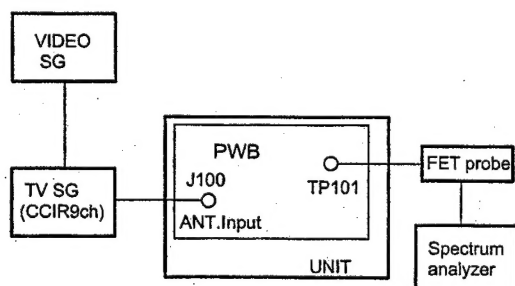

Fig.3

1. Solder-bridge the TP101 and TP102. And input the following signal of an antenna input.
C.C.I.R 9ch output level: 85dB μ
Visual signal: multi-burst signal
Voice modulation: 1kHz 30% (± 15 kHz) Dev. MONO
2. Adjust the VR501 so that the display level of the spectrum analyzer becomes 97dB μ to test pattern TP101. (Fig.4)
The set value of the spectrum analyzer is as follows.
(Use the FET probe for measuring.)
RES \cdot BW = 300kHz
V \cdot BW = 300kHz
 f_0 = 38.9MHz
f.span = 10MHz

3. Soft mute adjustment.

Wiring connection

Fig.4

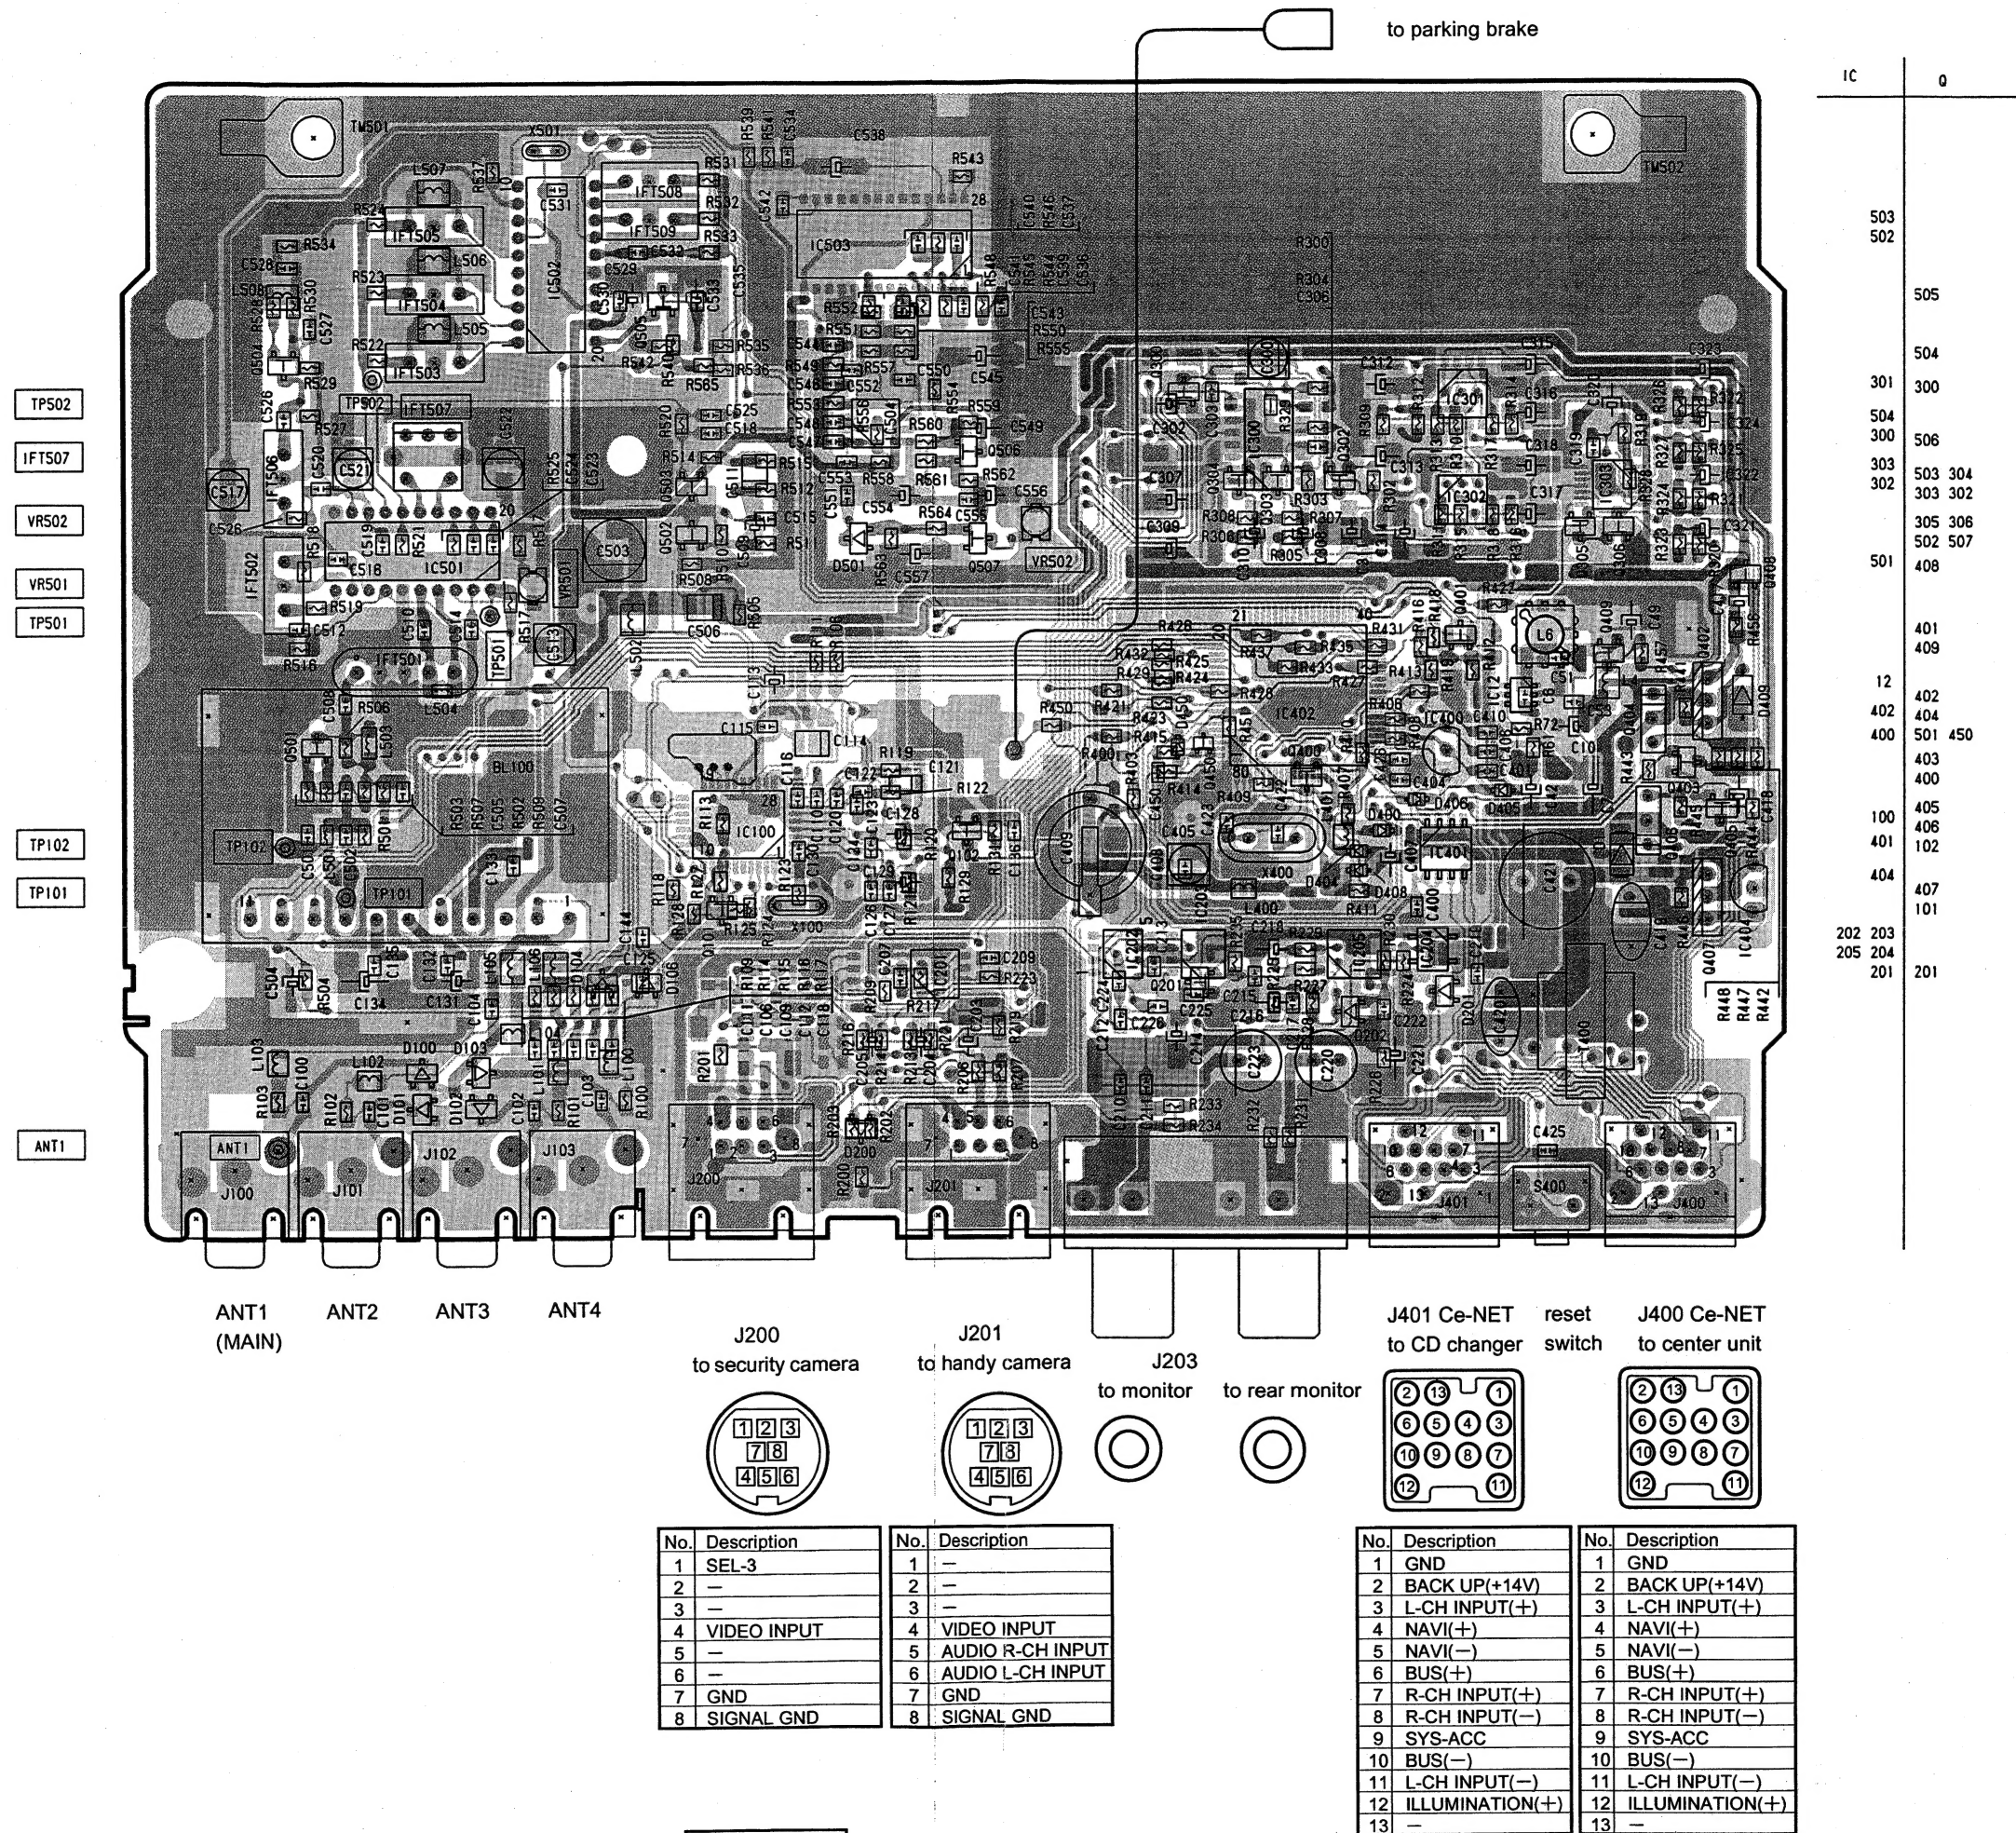

1. Input the following signal.
C.C.I.R 9ch output level: 65dB μ
Image signal: EBU color bar signal
Voice modulation: 1kHz 30% (± 15 kHz) Dev. MONO
2. The point on which SP output of center does not clip is defined 0dB.
3. Adjust the VR502 so that the voice output level drops by 10dB \pm 1dB when the RF input is set to 0dB.
